What is microtransit?
Microtransit functions like Uber and Lyft, but it uses transit vehicles and drivers and offers affordable and predictable fares.

In Scenario 1, passengers could request an on-demand microtransit trip using an app or a phone call to take trips within each of the four zones, or to connect to the fixed route system for longer trips across town.

What is interlining?
Interlining occurs when a bus serves two routes, alternating back and forth between the two.

Passengers benefit from interlining by not having to transfer between buses when traveling from one interlined route to another. In Scenario 1, there are four pairs of interlined routes: 1 & 5, 4 & 10, 7 & 11, and 9 & 29.

As an example, someone who lives near Overland Dr. & Queens Rd. would not only have access to Route 4, but could also take a one-seat ride to LMH Health West on Route 4, where the bus would then continue as Route 10 to the Bob Billings Transfer Facility.
